

ABSTRACT

A holder fuse device includes a base, two planar conductor blades secured to the base and extended outward of the base, each of the planar conductor blades includes a groove formed between two ears, and an opening communicating with the groove and having a width greater than that of the groove of the planar conductor blades. A fuse member includes two ends engaged into the openings via the grooves of the planar conductor blades, and having a diameter greater than that of the opening of the planar conductor blades, to secure and retain the ends of the fuse member in the opening of the planar conductor blades.
